

Analysis First-Year Exam, May 2017, Part 1

Answer *FOUR* questions in detail. State carefully any results used without proof.

1. Let $f : [0, 1] \rightarrow [0, 1]$ be increasing. By considering the set

$$A = \{t \in [0, 1] : t \leq f(t)\}$$

or otherwise, prove that there exists $a \in [0, 1]$ such that $f(a) = a$.

2. Let X be a metric space, of which U is an open subset and A an arbitrary subset. Prove that

$$U \cap \overline{A} \subseteq \overline{U \cap A}.$$

3. Let $f : X \rightarrow Y$ be a map between metric spaces. Prove that if $(f(x_n))_{n=0}^{\infty}$ converges in Y whenever $(x_n)_{n=0}^{\infty}$ converges in X , then f is continuous. [Note: it is not given that $f(x_n) \rightarrow f(x)$ whenever $x_n \rightarrow x$.]
4. Let $B \subseteq \mathbb{R}$ be bounded and $f : B \rightarrow \mathbb{R}$ uniformly continuous. True or false: $f(B) \subseteq \mathbb{R}$ is bounded? Give a proof or counterexample, as appropriate.
5. Let $f : (-a, a) \rightarrow \mathbb{R}$ be continuous everywhere and differentiable at each nonzero point. Show that if the limit $\ell = \lim_{t \rightarrow 0} f'(t)$ exists then f is in fact continuously differentiable at 0 with $f'(0) = \ell$.
