

# Logic PhD Exam, May 2017

---

*Answer six questions, at least one in each section.*

## Section 1

1. State and prove Tarski's criterion for elementarity of submodels.
2. State and prove the downward Löwenheim–Skolem theorem.
3. Prove that the models  $\langle \mathbb{Z}, \leq \rangle$  (integers with the usual ordering) and  $\langle \mathbb{Z} + \mathbb{Z}, \leq \rangle$  (two copies of integers with the usual ordering, one following the other) are elementarily equivalent.

## Section 2

1. Prove that for any cardinal  $\kappa$ , the cofinality  $\text{cf}(2^\kappa) > \kappa$ .
2. Show that the wellordering principle implies the Zorn's lemma.
3. Show that a c.c.c. forcing preserves all cardinals.

## Section 3

1. Show that every infinite computably enumerable set has an infinite computable subset.
2. Show that there are two subsets of  $\omega$  which are incomparable in the sense of the Turing ordering.
3. Explain what a  $\Pi_1^1$  complete set is and provide an example with a proof.
