

Numerical Analysis PhD Exam, January 2020

Do 4 (four) of the first 5 (1–5) and 4 (four) of the last 5 problems (6–10).

1. Let $A \in \mathbb{C}^{m \times n}$.

- (a) Determine constants α and β such that the following inequality holds for the p and ∞ norms of matrix A , for integers $p \geq 1$. Justify your answer.

$$\alpha \|A\|_{\infty} \leq \|A\|_p \leq \beta \|A\|_{\infty}.$$

- (b) Prove or give a counterexample: $\|A\|_2 \leq \|A\|_F$, where $\|A\|_F$ is the Frobenius norm of A . If you prove this, make sure to justify each nontrivial step.

2. Suppose A is Hermitian positive definite.

- (a) Prove that each principal submatrix of A is Hermitian positive definite.
(b) Prove that an element of A with largest magnitude lies on the diagonal.
(c) Prove that A has a Cholesky decomposition.

3. Define the matrices A and B by

$$A = \begin{pmatrix} 1 & 2 & 0 \\ 1 & 2 & 0 \\ 1 & 2 & 0 \\ 1 & 2 & 0 \end{pmatrix}, \quad B = \begin{pmatrix} 1 & 0 & 1 \\ 0 & 2 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{pmatrix}.$$

- (a) Find both full and economy singular value decompositions of A .
(b) Find both full and economy QR decompositions of B .

4. Let $\|\cdot\|$ be a subordinate (induced) matrix norm.

- (a) If E is $n \times n$ with $\|E\| < 1$, then show $I + E$ is nonsingular and

$$\|(I + E)^{-1}\| \leq \frac{1}{1 - \|E\|}.$$

- (b) If A is $n \times n$ invertible and E is $n \times n$ with $\|A^{-1}\|\|E\| < 1$, then show $A + E$ is nonsingular and

$$\|(A + E)^{-1}\| \leq \frac{\|A^{-1}\|}{1 - \|A^{-1}\|\|E\|}.$$

5. Suppose the linear equation $Ax = b$, with

$$A = \begin{pmatrix} \delta & 1 \\ 1 & 1 \end{pmatrix}, \quad |\delta| < \epsilon_m/4,$$

is solved on a floating-point system with machine-epsilon ϵ_m , using an LU factorization (no pivoting!) followed by forward and back substitution. (You may assume the operations $(+, -, \div, \times)$, do not incur any additional errors.)

- (a) If $b = (1, 0)^T$, compute the backward error, $\|\hat{b} - b\|_2 / \|b\|_2$, where $\hat{b}$ is the data that satisfies $A\hat{x} = \hat{b}$, and $\hat{x}$ is the computed solution.
- (b) Is the result of (a) sufficient to draw any conclusions about the backward-stability of the algorithm used to compute $\hat{x}$? Explain.

6. This problem has two parts.

- (a) Starting with the first two Legendre polynomials over $[-1, 1]$, given by $p_0(x) = 1$, and $p_1(x) = x$, find the next three (monic) Legendre polynomials, $p_2(x)$, $p_3(x)$ and $p_4(x)$.
- (b) Find the nodes t_0, t_1, t_2 and weights w_0, w_1, w_2 which define the Gaussian Quadrature formula

$$\int_{-1}^1 f(t) dt \approx w_0 f(t_0) + w_1 f(t_1) + w_2 f(t_2),$$

with degree of exactness $m = 5$. You should find the nodes exactly, and may leave the weights w_0, w_1, w_2 , in integral form.

7. Consider the fixed point problem $x = f(x)$, where $f(x) = e^{-(3+x)}$.

- (a) Assuming all computations are done in exact arithmetic, find the largest open interval in $\mathbb{R}$ where the fixed-point iteration $x_{k+1} = f(x_k)$ is ensured to converge.
- (b) Write a Newton iteration for finding the fixed-point.

8. Let P_1 be the space of polynomials of degree at most one. Using the norm $\|u\|_2 = \left(\int_a^b u^2 dx\right)^{1/2}$

- (a) Find the least-squares approximation to $f(x) = x^3$ in P_1 over $[a, b] = [-1, 1]$.
- (b) Find the least-squares approximation to $f(x) = x^4$ in P_1 over $[a, b] = [0, 1]$.

9. This problem has two parts.

- (a) Find a natural cubic spline B_0 on $-1 \leq x \leq 1$ that satisfies $v(-1) = 0$, $v(0) = 2$, and $v(1) = 0$.
- (b) Find a natural cubic spline on $-1 \leq x \leq 2$ that satisfies $v(-1) = 0$, $v(0) = 2$, $v(1) = 1/2$ and $v(2) = 0$. You may write the solution as $B = B_0 + B_1$, where B_0 is (or is closely related to) the solution to (a), if you like.

10. Let $f \in C^\infty(a - H, a + H)$, and let $h < H$. Let $x_0 = a - h$, $x_1 = a$ and $x_2 = a + h$.

- (a) Find the finite difference approximation to $f''(a)$ based on the quadratic interpolant p_2 which satisfies $p_2(x_0) = f(x_0)$, $p_2(x_1) = f(x_1)$ and $p_2(x_2) = f(x_2)$ (you should explicitly show how the difference approximation is derived from the interpolant).
- (b) Let $\psi_0(h) = \psi(h)$ be the difference approximation to $f''(a)$ found in part (a). Assume (in exact arithmetic) $\psi(h) \rightarrow \psi(0) = f''(a)$ as $h \rightarrow 0$, and that $\psi(h)$ has the asymptotic expansion

$$\psi(h) = \psi(0) + a_2 h^2 + a_4 h^4 + a_6 h^6 + \dots$$

Find the general Richardson extrapolation formula for $\psi_k(h)$ based on $\psi_{k-1}(h)$ and $\psi_{k-1}(h/2)$.
