

Algebra PhD Exam, May 2009

Answer exactly seven of the following eleven problems. You must show your work. Answers with no work and/or no explanations will receive no credit. State clearly any theorem you use in your proofs. In the problems, $\mathbb{Q}$ and $\mathbb{C}$ are the fields of rational numbers and complex numbers respectively.

1. Let $\mathcal{C}$ be a category, and denote by Set the category of sets.
 - (i) Define what it means for a functor $F : \mathcal{C}^{op} \rightarrow \text{Set}$ to be representable.
 - (ii) Show that if X, Y are objects of $\mathcal{C}$ representing the same functor $F : \mathcal{C}^{op} \rightarrow \text{Set}$, then $X \simeq Y$.
2. Let R be a ring with identity. Show that the following are equivalent:
 - (i) Every unitary left R -module is projective,
 - (ii) every unitary left R -module is injective,
 - (iii) every exact sequence of unitary left R -modules splits.
3. If G is a group, denote by G^{ab} the abelianization of G , and if X is a set, denote by $F(X)$ and $F^{ab}(X)$ the free group on X and the free abelian group on X respectively. Show that $F(X)^{ab} \simeq F^{ab}(X)$.
4. Let K be a field, $L = K(\alpha)$ a simple extension of K , and $\overline{K}$ an algebraic closure of K . Show that α is separable over K if and only if the ring $L \otimes_K \overline{K}$ has no nonzero nilpotent elements.
5. Show that if R is a Noetherian commutative ring with identity, then $R[X]$ is also Noetherian.
6. State and prove Artin's theorem on the linear independence of characters. and use it to prove the multiplicative form of Hilbert's Theorem 90.
7. Let $p(x) = x^7 - 3 \in \mathbb{Q}[x]$, $\zeta \in \mathbb{C}$ a primitive 7-th root of 1, and K the splitting field of $p(x)$.
 - (i) Compute the Galois group of $K/\mathbb{Q}$.
 - (ii) Compute the Galois group of $K/\mathbb{Q}(\zeta)$.
8. This problem has two parts.
 - (i) Give an example of extensions E/L , L/K where E/K is normal and L/K is not.
 - (ii) Give an example of normal extensions L/K , E/L such that E/K is not normal.
9. Let R be a Dedekind domain, and let I be a non-zero ideal of R .
 - (i) Show that R/I is Artinian.
 - (ii) Show that if a Dedekind domain is Artinian then it is a field.
10. Show that if L/K is any extension of fields, there is an algebraically independent set $\{\alpha_i\}_{i \in I}$ of elements of L such that L is algebraic over $K(\alpha_i, i \in I)$.
11. Let k be a field. A k -algebra R is central if the image of the structure map $k \rightarrow R$ is in the center of R .
 - (i) Suppose D is a central k -algebra that is a division algebra (in particular, D is a k -vector space). Show that if k is algebraically closed and D has finite dimension as a k -vector space, then $D = k$.
 - (ii) Use this result to show that if k is algebraically closed and R is a central k -algebra that is semisimple and of finite dimension over k , then R is a product of matrix algebras over k .
