

Variational Analysis/Numerical Optimization PhD Exam, May 2025

Do 8 problems, 4 from problems 1–5 and 4 from problems 6–10.

1. Recall that $f : \mathbb{R}^n \rightarrow \mathbb{R}$ is convex if and only if

$$f[(1 - \alpha)\mathbf{x} + \alpha\mathbf{y}] \leq (1 - \alpha)f(\mathbf{x}) + \alpha f(\mathbf{y})$$

for all $\mathbf{x}, \mathbf{y} \in \mathbb{R}^n$ and $\alpha \in [0, 1]$.

- (a) If f is continuously differentiable, then show that f is convex if and only if

$$f(\mathbf{y}) \geq f(\mathbf{x}) + \nabla f(\mathbf{x})(\mathbf{y} - \mathbf{x})$$

for all $\mathbf{x}, \mathbf{y} \in \mathbb{R}^n$.

- (b) If f is twice continuously differentiable, then show that f is convex if and only if $\nabla^2 f$ is positive semidefinite on $\mathbb{R}^n$.

2. Suppose that $\Phi : \mathcal{K} \rightarrow \mathbb{R}^n$ is continuously differentiable on $\mathcal{K} \subset \mathbb{R}^n$.

- (a) If $\mathcal{K}$ is a convex set, then show that

$$\|\Phi(\mathbf{x}) - \Phi(\mathbf{y})\| \leq \mu \|\mathbf{x} - \mathbf{y}\|$$

for all $\mathbf{x}$ and $\mathbf{y} \in \mathcal{K}$, where μ is the supremum of the singular values of $\nabla \Phi$ over $\mathcal{K}$.

- (b) If Φ is a contraction on $\mathcal{K}$, where $\mathcal{K}$ is a closed set, and $\Phi(\mathbf{x}) \in \mathcal{K}$ for each $\mathbf{x} \in \mathcal{K}$, then show that Φ has a unique fixed point in $\mathcal{K}$.

3. Let $\mathbf{U}$ and $\mathbf{V} \in \mathbb{R}^{n \times m}$ and $\mathbf{M} \in \mathbb{R}^{n \times n}$ with $\mathbf{M}$ invertible.

- (a) If $\mathbf{I} + \mathbf{V}^T \mathbf{M}^{-1} \mathbf{U}$ is invertible, then show that $\mathbf{M} + \mathbf{U} \mathbf{V}^T$ is invertible with

$$(\mathbf{M} + \mathbf{U} \mathbf{V}^T)^{-1} = \mathbf{M}^{-1} - \mathbf{M}^{-1} \mathbf{U} (\mathbf{I} + \mathbf{V}^T \mathbf{M}^{-1} \mathbf{U})^{-1} \mathbf{V}^T \mathbf{M}^{-1}.$$

- (b) If $\mathbf{U} = \mathbf{V} = \mathbf{A} \in \mathbb{R}^{n \times m}$, where the columns of $\mathbf{A}$ are linearly independent, and $\mathbf{M} = \mathbf{Q}$, a symmetric matrix, then show that

$$(\mathbf{Q} + p \mathbf{A} \mathbf{A}^T)(\mathbf{I} + p \mathbf{A} \mathbf{A}^T)^{-1} = \mathbf{Q}_0 + \mathcal{O}(1/p),$$

where

$$\mathbf{Q}_0 = \mathbf{Q} + (\mathbf{I} - \mathbf{Q})[\mathbf{A}(\mathbf{A}^T \mathbf{A})^{-1} \mathbf{A}^T].$$

4. Consider the following quadratic program:

$$\min q(\mathbf{x}) := \sum_{i=1}^n 0.5x_i^2 + c_i x_i \quad \text{subject to} \quad \mathbf{a}^T \mathbf{x} = b, \quad \mathbf{x} \geq 0. \quad (\text{QP})$$

where $\mathbf{c}$ and $\mathbf{a} \in \mathbb{R}^n$, $\mathbf{a} \geq 0$, and $b > 0$ is a scalar.

- (a) Develop an algorithm for solving (QP) by maximizing the dual function

$$L(\lambda) = \inf\{q(\mathbf{x}) + \lambda(\mathbf{a}^\top \mathbf{x} - b) : \mathbf{x} \geq 0\}$$

over the dual multiplier λ . Here, the constraint $\mathcal{K}$ in the dual function is taken as $\mathcal{K} = \{\mathbf{x} \in \mathbb{R}^n : \mathbf{x} \geq 0\}$.

- (b) Given the optimal λ for the dual problem, what is the solution of the primal problem?

5. Consider the primal problem

$$\min f(\mathbf{x}) \quad \text{subject to} \quad \mathbf{A}\mathbf{x} - \mathbf{b} = 0, \quad \mathbf{g}(\mathbf{x}) \leq 0, \quad (\text{P})$$

where $f : \mathbb{R}^n \rightarrow \mathbb{R}$ and the components of $\mathbf{g} : \mathbb{R}^n \rightarrow \mathbb{R}^l$ are convex and continuously differentiable, $\mathbf{A} \in \mathbb{R}^{m \times n}$, and $\mathbf{b} \in \mathbb{R}^m$. The dual problem is

$$\max L(\boldsymbol{\lambda}, \boldsymbol{\mu}) \quad \text{subject to} \quad \boldsymbol{\lambda} \in \mathbb{R}^m, \quad \boldsymbol{\mu} \in \mathbb{R}^l, \quad \boldsymbol{\mu} \geq 0, \quad (\text{D})$$

where

$$\begin{aligned} L(\boldsymbol{\lambda}, \boldsymbol{\mu}) &= \inf\{\mathcal{L}(\mathbf{x}, \boldsymbol{\lambda}, \boldsymbol{\mu}) : \mathbf{x} \in \mathbb{R}^n\}, \\ \mathcal{L}(\mathbf{x}, \boldsymbol{\lambda}, \boldsymbol{\mu}) &= f(\mathbf{x}) + \boldsymbol{\lambda}^\top (\mathbf{A}\mathbf{x} - \mathbf{b}) + \boldsymbol{\mu}^\top \mathbf{g}(\mathbf{x}). \end{aligned}$$

- (a) Show that if (P) has a local minimizer $\mathbf{x}^*$, then $\mathbf{x}^*$ is a global minimizer for (P). Moreover, if the first-order optimality conditions hold at $\mathbf{x}^*$, then there is a solution to (D) with no duality gap.
- (b) Returning to (QP) of problem 4, show that there is no duality gap. You may wish to consider both the set

$$S = \{(r, s) \in \mathbb{R}^2 : r \geq q(\mathbf{x}) \text{ and } s = \mathbf{a}^\top \mathbf{x} - b \text{ for some } \mathbf{x} \geq 0\},$$

and the point $(q^*, 0)$, where q^* is the optimal cost for (QP). Explain why this point does not lie in the interior of S . Use the separating hyperplane theorem to separate S and the point, and then analyze the resulting inequality.

6. Consider the initial-value problem

$$\dot{\mathbf{x}}(t) = \mathbf{f}(\mathbf{x}(t), \mathbf{u}(t)), \quad \mathbf{x}(0) = \mathbf{a},$$

where $\mathbf{a} \in \mathbb{R}^n$, $\mathbf{f} : \mathcal{B}_\delta(\mathbf{a}) \times \mathcal{U} \rightarrow \mathbb{R}^n$, with $\mathcal{U} \subset \mathbb{R}^m$ a compact set and $\delta > 0$. It is assumed that $\mathbf{f}$ is continuous on $\mathcal{B}_\delta(\mathbf{a}) \times \mathcal{U}$ and uniformly Lipschitz continuous in its first argument with Lipschitz constant L satisfying

$$|\mathbf{f}(\mathbf{x}_1, \mathbf{u}) - \mathbf{f}(\mathbf{x}_2, \mathbf{u})| \leq L|\mathbf{x}_1 - \mathbf{x}_2|$$

for all $\mathbf{x}_1, \mathbf{x}_2 \in \mathcal{B}_\delta(\mathbf{a})$ and $\mathbf{u} \in \mathcal{U}$. If $\epsilon = \delta/M$, where

$$M = \max\{|\mathbf{f}(\mathbf{x}, \mathbf{u})| : \mathbf{x} \in \mathcal{B}_\delta(\mathbf{a}), \mathbf{u} \in \mathcal{U}\},$$

then show that the initial-value problem has a unique, absolutely continuous solution on the interval $[0, \epsilon]$ with $\mathbf{x}(t) \in \mathcal{B}_\delta(\mathbf{a})$ for all $t \in [0, \epsilon]$.

7. Consider the equation

$$(P(x)u'(x))' = Q(x)u(x), \quad x \in [0, 1]. \quad (\text{E})$$

where Q is continuous and P is continuously differentiable and strictly positive on $[0, 1]$. Show that if the solution to the initial-value problem for (E) with $u(0) = 0$ and $u'(0) = 1$ is strictly positive on the half-open interval $(0, 1]$, then there exists a strictly positive solution to the second-order differential equation (E) (without boundary conditions at $x = 0$ or $x = 1$).

8. Consider the variational problem

$$\min \int_0^1 \left(\frac{1}{2} u'(x)^2 + e^{u(x)} \right) dx \quad \text{subject to} \quad u \in \mathcal{H}_0^1.$$

- (a) What is the first-order necessary optimality condition (Euler equation) for this variational problem?
- (b) Consider a uniform mesh $x_k = kh$, where $h = 1/N$; let u_k denote an approximation to $u(x_k)$. Of course, $u_0 = u_N = 0$. Give a finite difference approximation in terms $u_1, \dots, u_{N-1}$ to the solution of the Euler equation.
- (c) Let $\mathbf{F}(\mathbf{u})$ denote the finite difference system where $\mathbf{u} = (u_1, u_2, \dots, u_{N-1})^\top \in \mathbb{R}^{N-1}$, and let $\mathbf{u}^*$ denote the vector formed by evaluating the solution of the Euler equation at the mesh points $x_1, x_2, \dots, x_{N-1}$. Obtain a bound for the components of $\mathbf{F}(\mathbf{u}^*)$ in terms of the mesh spacing h .

9. Consider the initial-value problem

$$\dot{\mathbf{x}}(t) = \mathbf{A}(t)\mathbf{x}(t) + \mathbf{u}(t), \quad \mathbf{x}(0) = 0,$$

where $\mathbf{x} : [0, 1] \rightarrow \mathbb{R}^n$ and $\mathbf{A} \in \mathcal{L}^\infty([0, 1]; \mathbb{R}^{n \times n})$.

- (a) Assuming $\mathbf{u} \in \mathcal{L}^2$, obtain a bound for the sup-norm of $\mathbf{x}$ in terms of the $\mathcal{L}^2$ norm of $\mathbf{u}$.
- (b) Let $\Omega : \mathcal{H}_0^1 \rightarrow \mathbb{R}$ be defined by

$$\Omega(h) = \frac{1}{2} \int_0^1 r^2(x) dx \quad \text{where } r(x) = h'(x) + w(x)h(x).$$

Show that there exists $\beta > 0$ such that

$$\Omega(h) \geq \beta(\|h\|^2 + \|h'\|^2) \quad \text{for all } h \in \mathcal{H}_0^1,$$

where $\|\cdot\|$ is the $\mathcal{L}^2$ norm.

- (c) Consider the quadratic programming problem

$$\min \frac{1}{2} \mathbf{x}^\top \mathbf{R} \mathbf{x} + \mathbf{b}^\top \mathbf{x} \quad \text{subject to} \quad \mathbf{x} \in \mathcal{K},$$

where $\mathcal{K} \subset \mathbb{R}^n$ is a closed convex set and $\mathbf{R} \in \mathbb{R}^{n \times n}$ is positive definite with smallest eigenvalue $\alpha > 0$. Show that the solutions $\mathbf{u}_i$, $i = 1, 2$, associated with $\mathbf{b} = \mathbf{b}_i$, $i = 1, 2$ respectively, satisfy

$$\|\mathbf{u}_1 - \mathbf{u}_2\| \leq \|\mathbf{b}_1 - \mathbf{b}_2\|/\alpha.$$

10. Consider the following control problem:

$$\min \int_0^1 \left(\frac{1}{2} u^2(x) + y(x) \right) dx \quad \text{subject to} \quad y'(x) = u(x), \quad y(0) = 0, \quad u(x) \geq \ell(x),$$

where $\ell(x)$ is a given lower bound for the control $u(x)$ at each $x \in [0, 1]$.

- (a) What is the first-order optimality condition (Pontryagin minimum principle) for this problem?
- (b) What is the solution of the control problem?
